

Data fairness reflection- task 3

Basis:

My standard to judging neighborhoods is under four principles: transparency- accountability- responsibility-fairness. Some groups in this dataset were under-represented since they did not get a fair chance and members were a lot smaller

Findings:

Code:

```
#comparing neighborhood side by side
df = pd.read_csv('task2_cleaned_data.csv')

members = df.groupby('neighborhood')['member_id'].nunique()
checkouts = df.groupby('neighborhood')['checkout_id'].count()

neighborhood= pd.DataFrame({'members': members, 'checkouts': checkouts})
print(neighborhood)
```

Results:

I found that shubra is under-represented because it has 5 members which is tiny compared to the rest of the neighborhoods.

	members	checkouts
neighborhood		
Heliopolis	13	87
Maadi	20	114
Nasr City	16	101
Shubra	5	34
Zamalek	11	68

Reasons:

There could be different reasons. Like they aren't aware or they live far away. Or that library opens up at a time where they go to work or in the evening where the streets are crowded.

Next step:

Library could have a sign in drive to shubra or pop up in different schools and in the street. It could also do a partnership with a school. And it could be available and open all day so it can be accessible at all times.
